

EchoWare - Adaptive Agents in an Intelligent System

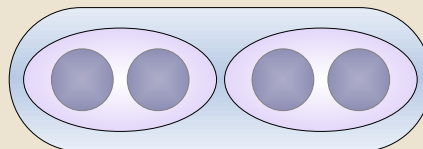

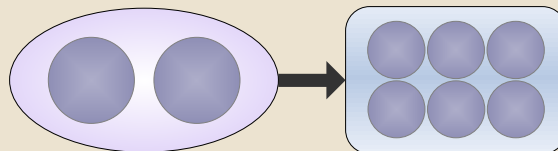

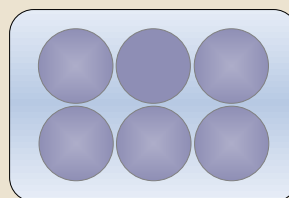

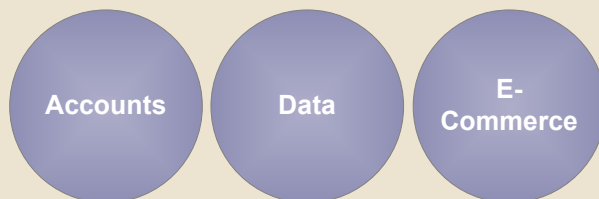

This is an agent

An agent is an autonomous program which adapts itself to provide the most efficient way to accomplish any number of tasks involving communication, data transfer, business in applications

Echo Messaging Systems creates compatible interchangeable agents that accomplish tasks that respond to Events, Devices, Timers, Locations, ...

Using a common intermediate data representation, EchoWare recombines agents and systems of agents to solve larger and more complex problems – Creating more robust software faster, using few resources

By using these widely compatible agents as building blocks, EchoWare forms the basis for applications that bring systems together for data synchronization, multi-channel notification, and automated workflows

Echo Ware has been used for:

- * Find Me Safety
- * Find Me Tornado
- * Job Notification Service – Multi-channel Communication system for scheduling, accounting, ERP
- * DataSyncs – InfusionSoft, ServiceCEO, Quickbooks Online, Quickbooks Desktop, Sage 50, Caspio, ...
